

Developer Pack

Freelancer/Developer use only!

This module allow you to download you website source code for local debugging and edit your file directly in your back office with a powerful code editor.

License

This project is licensed under the GNU General Public License (GPLv3)

Feels free to contribute to this project directly on Github: [developerpack](#)

Usage

View system information

Click log to console => F12 to open your browser console => View result

Download source code

Choose a output filename, set rules for filtering which file to download
=> Create ZIP => Download your sourcecode.

Remember to delete your ZIP sourcecode frequently or else it will lead to security problems.

File editor

Click Open In Monaco => Start editing your file with a powerful text editor.

Remember to open the browser log to list what files and directory you can open. It may be hard to use at first, but when you are familiar with it (the linux way), it will be faster than using your mouse

This module is so limited. I can't create a new folder bla bla bla...

I believe if a developer has access to create a php file, he can do everything!

For example. Just create a php file, like "foo.php" and put this code inside: `<?php mkdir('foo') ?>`, then open it in the browser, like <https://myprestashop.com/foo.php>, now you got your foo folder. And don't forget to delete the "foo.php" after the work is done!

Hope you enjoy working with our developerpack!
